

When there is an intersection of two chords in a circle, products of distances from the intersection to two endpoints of each chord are equal.

한 원에서 두 현의 교점이 있을 때 각각의 현의 두 끝점에서 교점까지의 거리의 곱은 같다

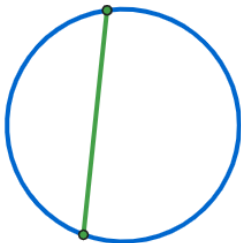

(When there is an intersection of two chords in a circle, products of distances from the intersection to two endpoints of each chord are equal.)

When there is an intersection of two chords in a circle, products of distances from the intersection to two endpoints of each chord are equal.

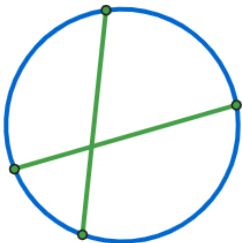

When there is an intersection of two chords in a circle, products of distances from the intersection to two endpoints of each chord are equal.

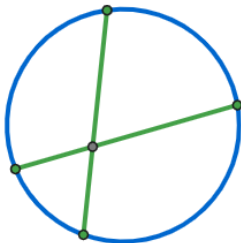

When there is an intersection of two chords in a circle, products of distances from the intersection to two endpoints of each chord are equal.
