

When there is an intersection of two chords in a circle, the product of the distances from the two endpoints of each chord to the intersection is the same.

한 원에서 두 현의 교점이 있을 때 각각의 현의 두 끝점에서 교점까지의 거리의 곱은 같다.

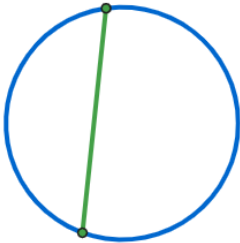

(When there is an intersection of two chords in a circle, the product of the distances from the two endpoints of each chord to the intersection is the same.)

When there is an intersection of two chords in a circle, the product of the distances from the two endpoints of each chord to the intersection is the same.

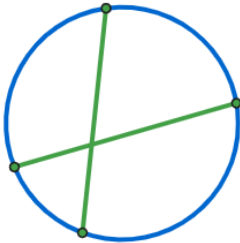

When there is an intersection of two chords in a circle, the product of the distances from the two endpoints of each chord to the intersection is the same.

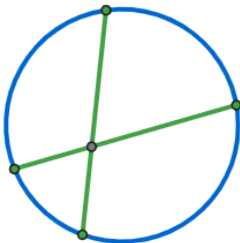

When there is an intersection of two chords in a circle, the product of the distances from the two endpoints of each chord to the intersection is the same.

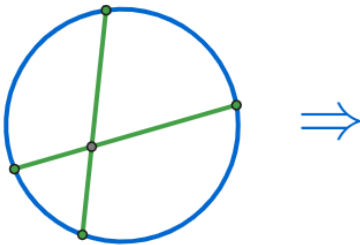

When there is an intersection of two chords in a circle, the product of the distances from the two endpoints of each chord to the intersection is the same.
